

## Abstract

An electric machine, in particular an alternator for motor vehicles, having a stator (16), which supports a stator winding (18) that has winding ends (78),  
5 having a voltage regulator assembly (65), and having a rectifier. The electrical connection between the winding ends (78) and the rectifier is situated underneath the voltage regulator assembly (65).

A stator for an electric machine, in particular for an alternator for motor  
10 vehicles, having a stator (16), which supports a stator winding (18) that has winding ends (78). The winding ends (78) are connected to an additional conductor element (80), which joins a plurality of individual wires of the winding ends (78) together by means of a clamp-like junction region (81) and is embodied  
15 in the form of a sheet metal part.
